WORKSHOP OVERVIEW

Meet Northwind Traders

Hi!

Specialty food distributor. Big on soup. Bigger on on-time delivery.

WE SELL

Foods and drinks under our own label

WE BUY

From a network of trusted suppliers

WE PROMISE

Every order, on time

BREAKING NEWS

Supplier F is 14 days late on Clam Chowder — 3 orders and USD 868.50 at risk.

Today, you fix that.

WORKSHOP OVERVIEW

Turn one supplier delay into a governed, intelligent business process

Today you build the Agentic Operations Control Tower for Northwind Traders

- A model-driven app where operators see disruptions, impact, and decisions
- Cloud flows that turn a supplier email into cases, impacted orders, and a pending decision
- Copilot Studio agents that reason over policy, hand off to a human, and run a browser-only carrier step
- One human approval that triggers governed, evidenced execution
- A pipeline that promotes the solution from DEV to TARGET

Apps, automations, and agents on one platform — with Dataverse as the system of record

WORKSHOP OVERVIEW

What you will learn today

01

Design modern business apps that put agents to work

02

Automate multi-step business processes with workflows

03

Build agents that reason, act across systems, and work with people in the loop

04

Connect enterprise data with Dataverse and connectors

05

Apply architecture, governance, security, and ALM best practices

06

Bring it all together into one end-to-end process

WORKSHOP OVERVIEW

Full-day agenda

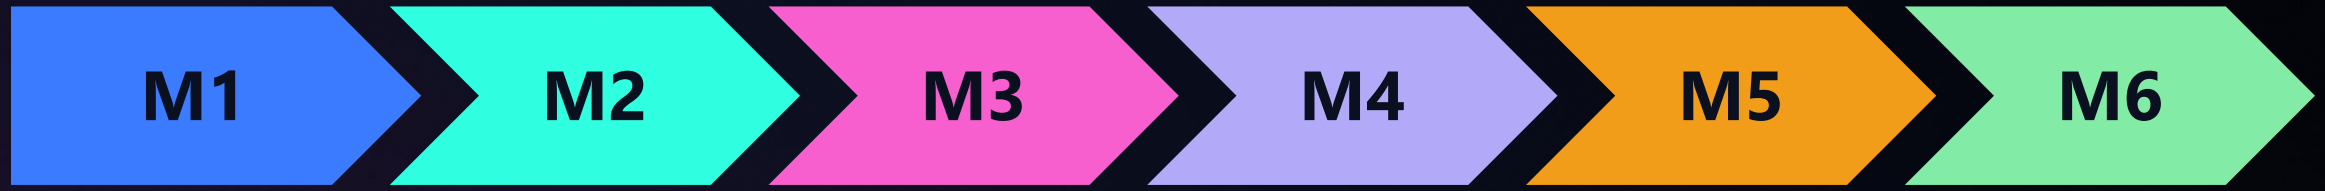

TIME		SESSION	OWNER	PRODUCTS	DURATION
9:00 AM		Welcome and introduction	All		20 min
9:20 AM	M1	Scenario overview and environment	Olivier		25 min
9:45 AM	M2	Building the Control Tower	Adrian		60 min
10:30 AM		*Break*			*15 min*
10:45 AM	M3	Intake and live impact (cloud flows + AI prompts)	Rasika		60 min
12:00 PM		*Lunch*			*60 min*
1:00 PM	M4	Policy, bounded reasoning, and human supervision	Nikita		60 min
2:00 PM		*Break*			*15 min*
2:15 PM	M5	Carrier agent and governed recovery	Jay		60 min
3:15 PM		*Break*			*10 min*
3:30 PM	M6	Deploy the Control Tower	Warren		30 min
4:00 PM		Recap and Q&A	All		30 min

Power Apps · Dataverse · Power Automate · AI Builder · Copilot Studio · Power Platform · GitHub Copilot

9:00 AM – 4:40 PM · modules and labs, plus Computer Use wait time

WORKSHOP OVERVIEW

Six modules, one solution

Orient
environment, data, authority boundary

App
extend the Control Tower (App Builder)

Automation
intake and impact automations (cloud flows + AI prompts)

Agents
policy, reasoning, human handoff (Agent feed)

Agent + automation
governed recovery with Computer Use

ALM
setup solutions and deploy with pipelines

Dataverse — system of record for every step

MODULE 1

1

MODULE 1

Scenario overview and environment

Open the workshop environment and understand the mission

15 min

M1 · Orient | M2 · App | M3 · Automation | M4 · Agents | M5 · Agent + automation | M6 · ALM

MODULE 1

The mission: Supplier F delays Clam Chowder by 14 days

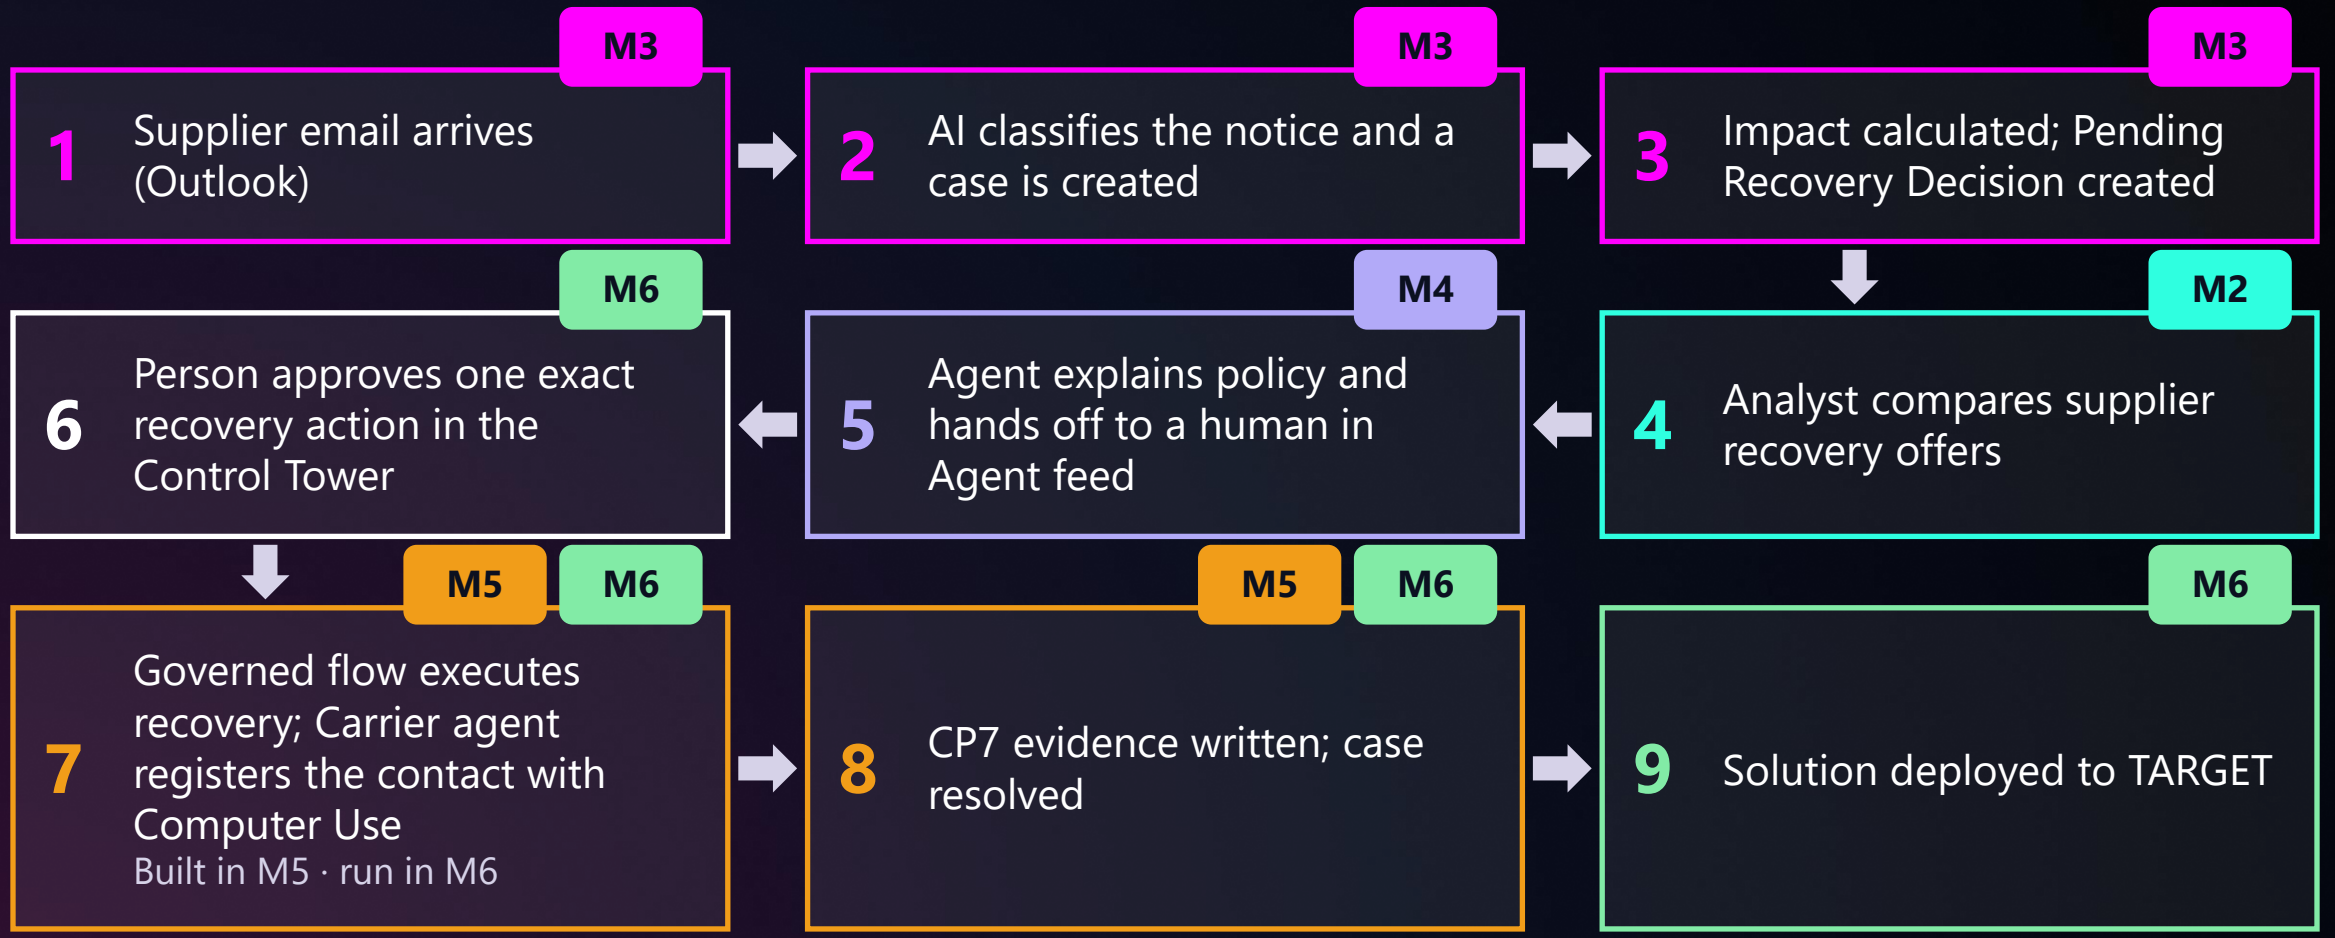

- Supplier F reports a 14-day delay for Northwind Traders Clam Chowder
- Three open orders are at risk
- Business policy lab-1 recommends a Split Shipment, with Expedite Reorder as an alternative
- The carrier contact must be registered on a browser portal with no supported API

ORDERS AT RISK

Order	Qty	Unit price	Exposure
0915	50	9.65	USD 482.50
0920	30	9.65	USD 289.50
0935	10	9.65	USD 96.50
Total			**USD 868.50**

MODULE 1

From supplier email to verified recovery

MODULE 1

Solution architecture: apps, automations, agents, and data

PEOPLE	**Operations analyst / approver** Control Tower		**Maker** builds in DEV			**ALM & GOVERNANCE** Solution: PPCC Agentic Operations Control Tower Power Platform pipelines (DEV → TARGET) Restricted tools Approval boundary
APPS	**PPCC Agentic Operations Control Tower** model-driven app	**Control Tower Home page**	**Supplier Recovery Offers extension**	**Agent feed** Needs attention items		
AGENTS Copilot Studio	**Disruption Commander** Business Skill lab-1 + Dataverse MCP (read-only)	**Disruption Approval Handoff Agent** Dataverse trigger · connected Commander · Power Apps MCP: request_assistance	**Carrier Operations Agent** Computer Use: Register Shipping Contact → hosted browser → approved carrier site only			
AUTOMATIONS cloud flows	**Order Disruption** Outlook trigger	**Supplier Disruption Impact Assessment** Dataverse trigger	**Approved Recovery Execution** fires on approval	**Invoke Carrier Operations** prepared child flow: re-checks approval, Execute Agent and wait, verifies the CUA Activity		
AI CONNECTIONS	**Run a prompt (AI Builder)** classify the email, explain the impact	**Office 365 Outlook**	**Microsoft Dataverse**	**Microsoft Copilot Studio**	**Power Apps MCP**	**Hosted browser**
DATA Dataverse	**Northwind Traders** orders, order details, products, suppliers, purchase orders	**Control Tower** disruption cases, impacted orders, recovery decisions, supplier offers, carrier operations and attempts, execution evidence (CP7), tasks				

MODULE 1

The authority boundary: prepare · decide · execute

THE SYSTEM MAY

PREPARE

- Detect the delay
- Calculate impact
- Apply policy
- Rank work
- Draft communications

Modules 3–4: cloud flows, AI prompts, agents

A PERSON MUST

DECIDE

- Approve, reject, or request revision for one exact recovery action
- Persisted in the Control Tower — an Agent feed task is not approval

Module 6: deployment destination

THE SYSTEM MAY, AFTER APPROVAL

EXECUTE

- Update Dataverse
- Register the carrier contact with Computer Use
- Write CP7 evidence — only for a verified, correlated Computer Use Activity
- Resolve the case

Module 5: guarded workflow + carrier adapter

A recommendation is not approval

Approval is not execution evidence

A Succeeded flow run is not a verified carrier submission

An ambiguous result is not permission to retry

MODULE 1

Set up your lab environment

1

Get credentials

2

Open your VM

VM link + VM credentials

3

Sign in to DEV

PPCC26-Customer-Lab-DEV

GOLDEN RULES

- Work in DEV
- Don’t edit baseline data
- One test, one save — never retry

MODULE 1 LAB 1

Lab 1 · Orient in DEV and verify the starting data

OBJECTIVE	Confirm your environment, data, and authority rules before building
STARTING POINT	Facilitator-prepared DEV environment with Northwind data and the app shell
MAJOR TASKS	Open the DEV app · Inspect order data · Check purchase orders · Record the authority boundary
COMPONENTS CREATED	None — verification only
DEPENDS ON	Workshop access card
SUCCESS LOOKS LIKE	App opens in DEV, orders 0915/0920/0935 total USD 868.50, no participant “CL” purchase order exists

MODULE 1

Module 1 recap: verified baseline, shared rules

BUILT
A verified starting point (no components yet)

CAPABILITIES USED
DEV environment, model-driven app, Dataverse data

BUSINESS VALUE
Everyone works from the same facts and the same authority rules

BEFORE YOU CONTINUE
- ✓ Correct DEV environment
- ✓ USD 868.50 recorded
- ✓ No CL purchase order

NEXT · MODULE 2

Module 2 extends the Control Tower so analysts can compare recovery offers

MODULE 2

2

MODULE 2

Building the Control Tower

Extend the Control Tower with App Builder

60 min

M1 · Orient | M2 · App | M3 · Automation | M4 · Agents | M5 · Agent + automation | M6 · ALM

MODULE 2

Extend the Control Tower with App Builder

WHAT YOU WILL BUILD

A Supplier Recovery Offer extension — table, form, two views, navigation, and a related grid on Disruption Case

DURATION

60 min

BUSINESS OUTCOME

Analysts compare supplier offers in a structured way before anyone approves recovery

WHERE IT FITS

Adds decision-support data to the app that people use to supervise the process

FROM

A verified baseline (Module 1)

TO

An app extended with AI-assisted building

MODULE 2

Module 2 key features: build the app with AI

Feature	What it is	What it helps accomplish	In this workshop
Generative pages	Describe a page in natural language; AI generates a React-based page for a model-driven app from Dataverse tables	Modern, task-focused pages without hand-coding — like the Control Tower Home page	Used in lab
App Builder for model-driven apps (vibe coding)	The app-builder skill in the Power Apps model-apps plugin for GitHub Copilot CLI	Extend an existing app from a requirements spec, with a reviewed dry-run plan before any change	Built in lab
Vibe coding canvas apps	AI coding agents such as GitHub Copilot author canvas apps through the Canvas Authoring MCP Server	Create or migrate canvas apps through conversation	Presenter talk track

MODULE 2 LAB 2

Lab 2 · Add supplier recovery offers to the Control Tower

OBJECTIVE	Use app-builder to extend the installed app with offer comparison
STARTING POINT	Installed Northwind Traders and Control Tower managed solutions with a seeded Pending disruption
MAJOR TASKS	Inspect app · Install plugin · Authenticate · Prompt with spec · Review and build · Compare offers
COMPONENTS CREATED	Supplier Recovery Offer table, Main form, Open Offers and Offers by Disruption views, navigation entry, related grid on Disruption Case
DEPENDS ON	Module 1 baseline; local CLI tooling
SUCCESS LOOKS LIKE	Two offers compared in both views; Recovery Decision still Pending; no carrier or evidence records created

MODULE 2

LAB 2 · STEPS 1–2 OF 6

Lab 2 steps: extend the Control Tower

1 Inspect the installed app

Open the seeded Supplier F / Clam Chowder case; record environment URL and current carrier/evidence records

WHY IT MATTERS

Baseline to prove nothing executes later

✓ Decision is Pending

2 Start GitHub Copilot CLI and install the plugin

Run copilot from the repo root, add the power-platform-skills marketplace, install model-apps, restart

✓ /skills lists app-builder

MODULE 2

LAB 2 · STEPS 3–4 OF 6

Lab 2 steps: extend the Control Tower

3 Authenticate to DEV

pac auth create , az login –use-device-code with the same account

✓ pac auth and az login gets configured

4 Prompt app-builder with the extension spec

Attach the Supplier Recovery Offer spec; ask for proposed changes and a dry-run plan before any write

✓ Proposal reuses the installed app and existing components

MODULE 2

LAB 2 · STEPS 5–6 OF 6

Lab 2 steps: extend the Control Tower

5 Review, approve, and build

Check solution, table, choice, form, views, navigation, roles, authority; then approve

✓ Extension published in its own unmanaged solution; gaps reported

6 Compare two offers

Create a faster/higher-cost and a slower/lower-cost offer; move one Received → Shortlisted → Not Selected

✓ Views behave as specified; decision still Pending

Shortlisting an offer is never approval to execute it.

MODULE 2

LAB 2 · SNEAK PEEK

MODULE 2

Module 2 recap: an extended app, not a rebuilt one

BUILT
Supplier Recovery Offer table, form, views, navigation, related grid

CAPABILITIES USED
App Builder in GitHub Copilot CLI, Dataverse, solution layering

BUSINESS VALUE
Structured offer comparison before a decision

VALIDATE
✓ Both views show your offers
✓ Recovery Decision is Pending
✓ No new Carrier Operation or Execution Evidence

NEXT · MODULE 3 Module 3 automates how disruption cases and impact get into the app

TRANSITION

Break

UP NEXT

MODULE 3

Build Power Automate Intake and live impact workflows

M1 · Orient | M2 · App | **M3 · Automation** | M4 · Agents | M5 · Agent + automation | M6 · ALM

MODULE 3

3

MODULE 3

A supplier is late. Managing Impact and Risk with Power Automate

Create supplier-delay intake and live impact Workflows

60 min

M1 · Orient | M2 · App | **M3 · Automation** | M4 · Agents | M5 · Agent + automation | M6 · ALM

MODULE 3

Turn a supplier email into live business impact

WHAT YOU WILL BUILD

Two automated cloud flows — Order Disruption, and Supplier Disruption Impact Assessment

DURATION

60 min

BUSINESS OUTCOME

A supplier notice becomes a case, impacted orders, calculated exposure, and a Pending decision — in minutes, without retyping

WHERE IT FITS

Feeds the Control Tower with the facts agents and people will act on

FROM

An app that displays disruptions (Module 2)

TO

Automation that creates them

MODULE 3

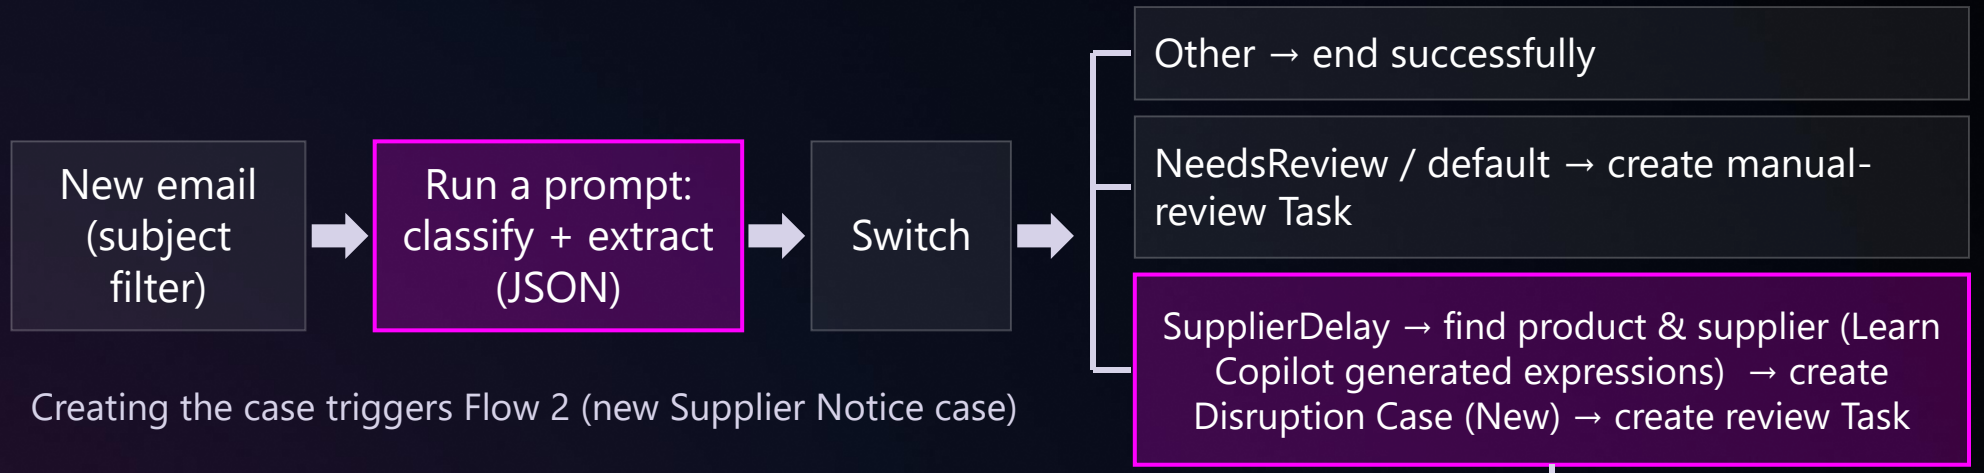

Module 3 key features: automation with AI where it helps

Feature	What it is	What it helps accomplish	In this workshop
Vibe coding cloud flows (preview)	Describe the automation in natural language; Copilot creates and edits the cloud flow	Start from intent instead of a blank designer, then refine	**Presenter talk track**
AI prompts (Run a prompt)	Reusable custom prompts with typed inputs, returning JSON or text that the flow uses directly	Classify the supplier email and explain the impact — while the flow keeps control of numbers and records	**Built in lab**
Expressions in cloud flows	Workflow expressions calculate exposure, distinct order counts, and record references; Copilot expression assistant (preview) can create and fix them	Deterministic, auditable calculations	**Built in lab**

MODULE 3

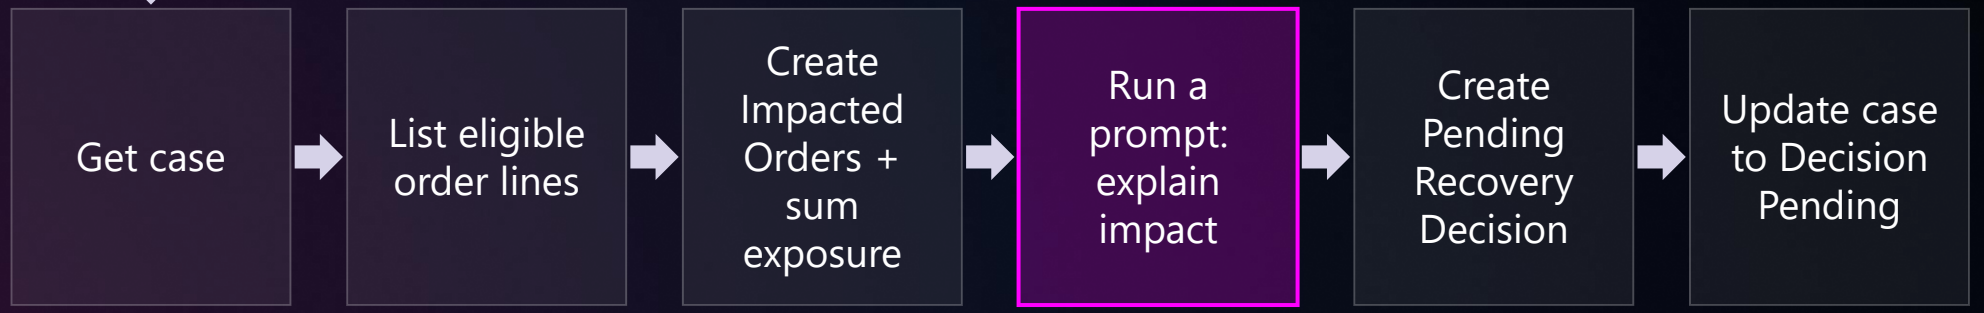

The flow calculates. AI explains.

FLOW 1
Order Disruption
trigger: new email

Creating the case triggers Flow 2 (new Supplier Notice case)

FLOW 2
Impact Assessment
trigger: new Supplier Notice case

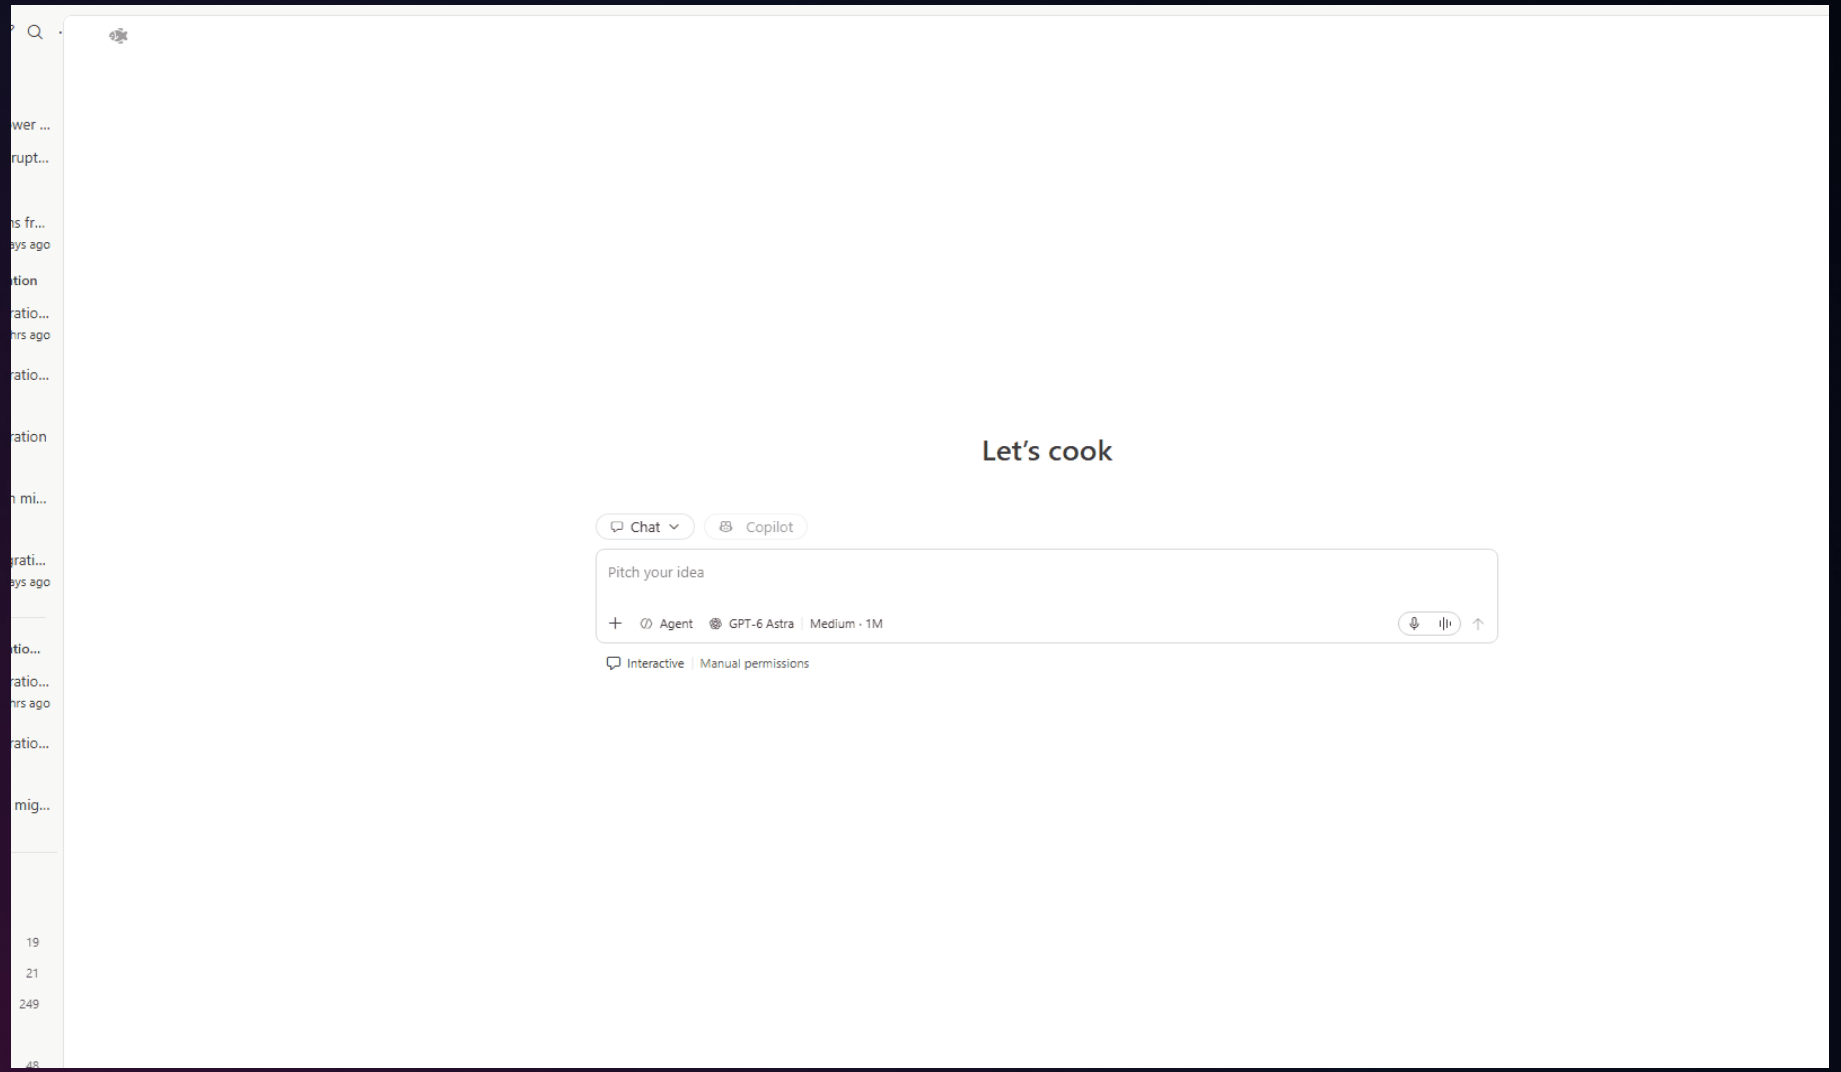

Prompts helps with classification and summarization

MODULE 3

DEMO · POWER AUTOMATE MCP

From prompt to running flow

MODULE 3

POWER AUTOMATE MCP · FROM YOUR CODING AGENT

Build and fix flows by asking

WHAT IT IS

Power Automate plugin

For GitHub Copilot CLI and Claude Code, powered by the FlowAgent MCP server and its 50+ flow tools.

Runs locally · Node.js 18+ · your az login

WHAT YOU CAN ASK IT TO DO

Build flows
Create, edit per action, copy, publish

Debug runs
Run history, loop drill-down, diagnosis

Manage connections
Create, fix, discover, resolve values

INSTALL

```
/plugin marketplace add microsoft/power-platform-skills
/plugin install power-automate@power-platform-skills
```

Source: github.com/microsoft/power-platform-skills · plugins/power-automate

AI helps us assist during build and runtime

BUILD TIME · MAKER HELP

Copilot expression assistant (preview)

Use when lookup or formatting syntax is hard to write.

Less syntax to author;
you still inspect and test.

TRY: link the case to the found product.

RUNTIME · EACH FLOW RUN

Run a prompt

Use when text needs interpreting or known facts need explaining.

Less manual reading and writing;
the flow keeps control.

TRY: classify the notice; explain the computed impact.

Expression: deterministic logic. Prompt: AI interprets or explains.

MODULE 3 LAB 3

Lab 3 · Build intake and impact assessment flows

OBJECTIVE	Automate supplier-delay intake and calculate live order impact
STARTING POINT	Control Tower solution, Northwind data, prepared Outlook and Dataverse connections, workshop mailbox
MAJOR TASKS	Build intake flow with AI classification · Build assessment flow with AI explanation · Add flows to the solution · Test end to end · Review in the Control Tower
COMPONENTS CREATED	2 cloud flows, 2 custom prompts
DEPENDS ON	Module 1 environment; Control Tower tables and choices
SUCCESS LOOKS LIKE	One email → case + review task + impacted orders + calculated exposure + one Pending decision; nothing executed

MODULE 3

LAB 3 · STEPS 1–2 OF 8

Build the intake flow

1 Create the Order Disruption flow

Automated cloud flow on “When a new email arrives (V3)”, Inbox, subject filter “PPCC Cloud Flow Lab”

✓ Trigger uses the workshop mailbox

2 Classify with a custom prompt

Run a prompt “Classify supplier notification” with JSON output (classification, reference, supplier, product, delay, reason)

✓ Prompt test returns the sample values

MODULE 3

LAB 3 · STEPS 3–4 OF 8

Build the intake flow

3 Route with a Switch

SupplierDelay, Other, and Default branches

✓ General updates create nothing; unclear notices create a review task

4 Create the case and review task

Find product and supplier, add the Disruption Case and linked Task

✓ Test email creates a case with Supplier F, Clam Chowder, 14 days, status New

MODULE 3

LAB 3 · STEPS 5–6 OF 8

Assess impact and validate

5 Build the assessment flow

Dataverse trigger on new Supplier Notice cases; get the case with related product, supplier, currency

✓ Trigger filter saved

6 Calculate exposure

List eligible order lines, create one Impacted Order per line, accumulate TotalExposure

✓ Each impact links to its order and order detail

MODULE 3

LAB 3 · STEPS 7–8 OF 8

Assess impact and validate

7 Explain and decide-ready

Run a prompt “Explain supplier disruption impact”; create a Pending Recovery Decision; update the case

✓ Case shows Decision Pending

8 Add to the solution and test

Add both flows to the Control Tower solution, turn them on, send one fresh email

✓ Both runs succeed; review results in Control Tower Home

MODULE 3

Module 3 recap: from inbox to impact

BUILT

Order Disruption and Impact Assessment cloud flows with two custom prompts

CAPABILITIES USED

Automated cloud flows, Run a prompt, Dataverse actions, expressions

BUSINESS VALUE

Faster, consistent triage with AI-written review guidance

VALIDATE

✓ Case is Decision Pending with calculated exposure

✓ Impacted orders link to source records

✓ One current Recovery Decision is Pending

NEXT · MODULE 4

Module 4 adds agents that apply policy and bring a human into the loop

TRANSITION

Lunch

UP NEXT

MODULE 4

Policy, bounded reasoning, and human supervision

Special Guest…

Saurabh Pant

Microsoft | CAPE
Community. Enablement. Impact.

Microsoft CAPE-supported Build-a-Thon

happening on Monday, Oct. 26!

FEEL THE POWER!
CAPE @ PPCC 2026

If you're attending CAPE PPCC26, make sure to check **Whova** for Monday's agenda and sign up for the **Feel the Power** event!

This is your **chance** to see creativity, innovation, and the Microsoft Power Platform community come alive through bold ideas, fast builds, and inspiring demos.

Whether you're a maker, mentor, judge, or cheerleader, this is one session you won't want to miss.

Come support the teams, celebrate what's possible, and feel the energy of the PPCC community. 💜

Open **Whova** › Check Monday's schedule ›

Let's show up, cheer loud, a
the power of community an

#Microsoft | #Community | #Innovation | #BuildAThon | #

MODULE 4

4

MODULE 4

Setup policy-driven agents that escalate to humans

60 min

M1 · Orient | M2 · App | M3 · Automation | M4 · Agents | M5 · Agent + automation | M6 · ALM

MODULE 4

Add agent-driven decision support with a human in the loop

WHAT YOU WILL BUILD

A Business Skill and two Copilot Studio agents — Disruption Commander and Disruption Approval Handoff Agent

DURATION

60 min

BUSINESS OUTCOME

Policy is applied consistently, explained clearly, and every decision goes to a person through Agent feed

WHERE IT FITS

Turns the Pending decision from Module 3 into a supervised review task

FROM

Automation that prepares facts (Module 3)

TO

Agents that reason over them, within limits to aide in human decision

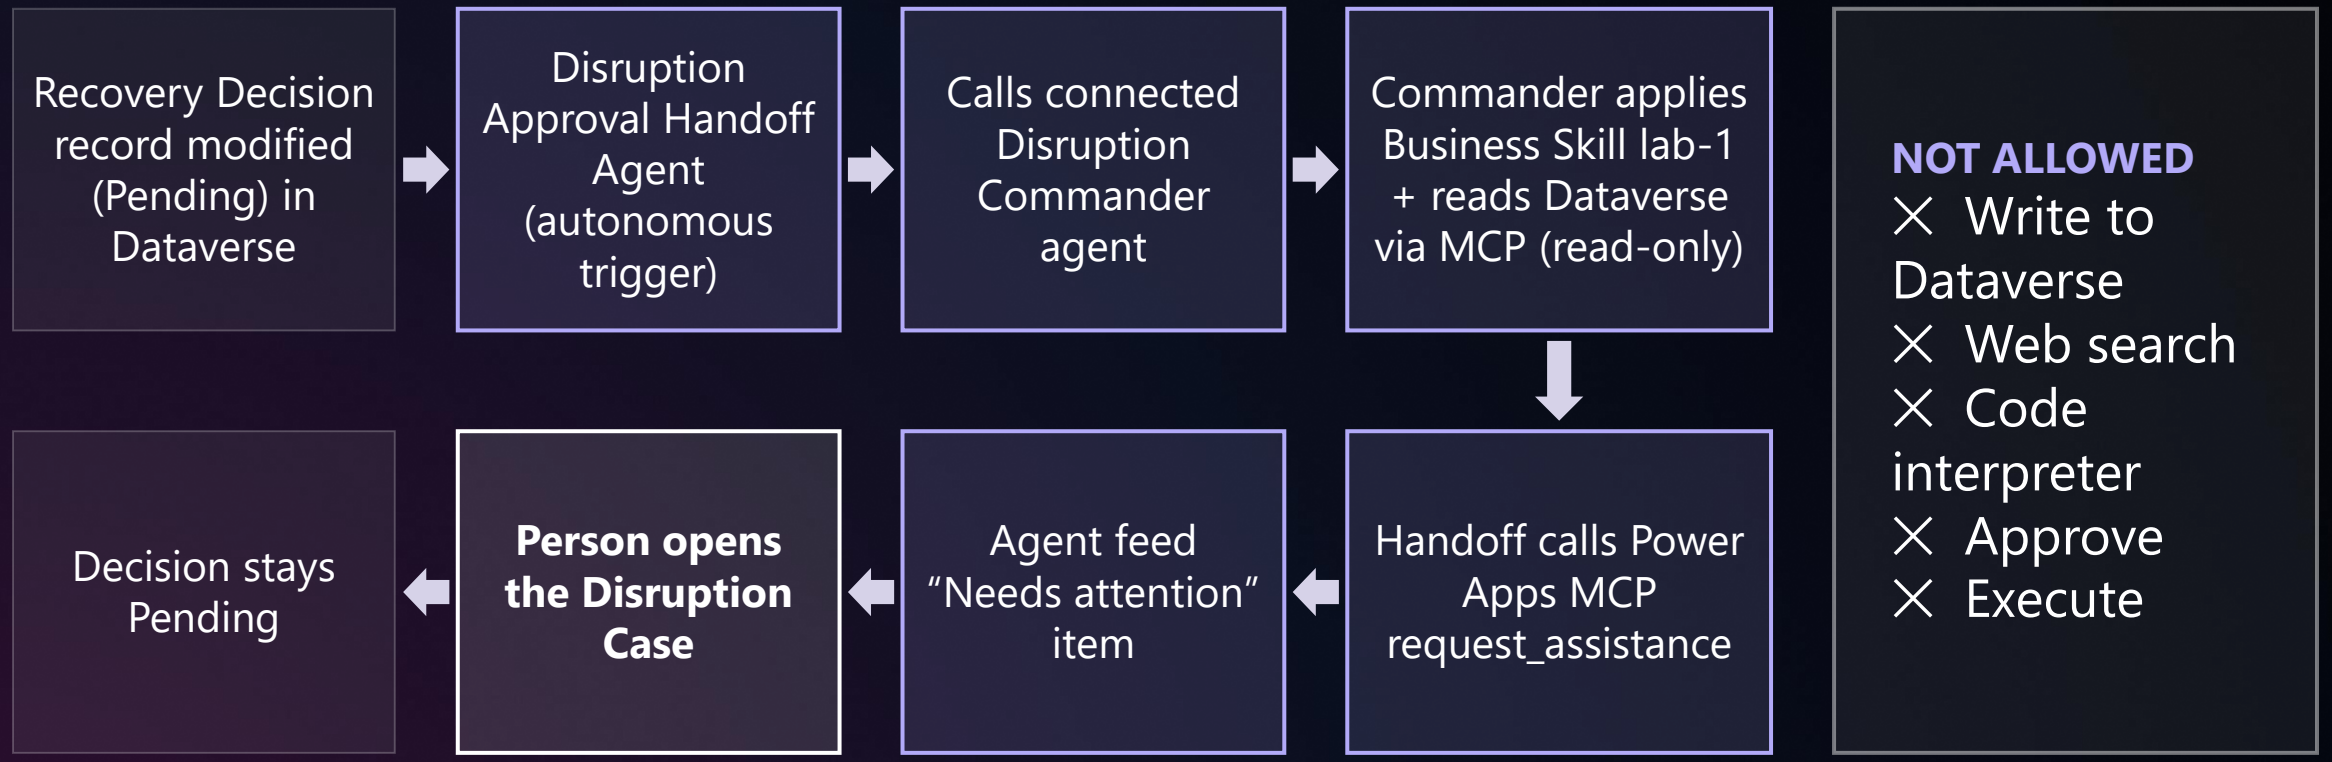

MODULE 4

Module 4 key features: bounded agents, people in the loop

Feature	What it is	What it helps accomplish	In this workshop
Copilot Studio agents (standard + GitHub Copilot harness)	Instructions, tools, connected agents, triggers; the GitHub Copilot harness is the newer runtime for reasoning-heavy agents	The lab uses Agent (Standard) so autonomous triggers are available	**Built in lab**
Business Skills (preview)	Processes and policies in natural language, stored in Dataverse, discovered by agents at runtime	One policy (lab-1) applied the same way by every agent	**Built in lab**
Dataverse MCP Server	MCP tools that give agents governed access to Dataverse tables and records, discovers Business Skills	The Commander reads evidence read-only: read_query, search, describe	**Built in lab**
Power Apps MCP Server (preview)	Lets agents work with model-driven apps (Can scope request_assistance, log_for_review, invoke_data_entry	The Handoff agent creates one human task — request_assistance only	**Built in lab**
Agent feed (preview)	A task feed in model-driven apps where people review and complete agent tasks	Human supervision in the app, with a link back to the case	**Used in lab**

MODULE 4

Bounded reasoning, human decision

MODULE 4 LAB 4

Lab 4 · Build the policy skill, Commander, and Handoff agent

OBJECTIVE	Apply policy with a read-only agent and route the decision to a human in Agent feed
STARTING POINT	Pending Recovery Decision and case from Module 3; facilitator Dataverse and Power Apps MCP connections
MAJOR TASKS	Business Skill · Commander agent + read-only Dataverse MCP · Disable web and code · Test refusal · Handoff agent + connected Commander + request_assistance · Autonomous trigger · Add to Agent feed · Verify one item
COMPONENTS CREATED	1 Business Skill, 2 agents, 1 trigger, 1 Agent feed association
DEPENDS ON	Module 3 decision and case
SUCCESS LOOKS LIKE	Commander explains and refuses execution; exactly one Needs attention item opens the case; no approval or execution record

MODULE 4

LAB 4 · STEPS 1–2 OF 8

Build policy and the Commander

1 Create the Business Skill

ppcc-order-disruption-triage from the repo prompt file; add it to the solution

✓ Preview shows policy version lab-1

2 Create Disruption Commander

Agent (Standard), instructions from the repo

✓ Agent saved in the solution

MODULE 4

LAB 4 · STEPS 3–4 OF 8

Build policy and the Commander

3 Add read-only Dataverse MCP

Allow all off; only read_query, search, describe

✓ Every write operation is off

4 Turn off web and code, publish, test

Ask it to explain the case and then execute Split Shipment

✓ Cites 3 orders, USD 868.50, lab-1, two alternatives — and refuses to execute

MODULE 4

LAB 4 · STEPS 5–6 OF 8

Hand off to a human

5 Create the Handoff agent

Agent (Standard) with handoff instructions; connect Disruption Commander

✓ Connected agents lists the Commander

6 Restrict Power Apps MCP

Shared account; only request_assistance on

✓ log_for_review and invoke_data_entry are off

MODULE 4

LAB 4 · STEPS 7–8 OF 8

Hand off to a human

7 Add the autonomous trigger and publish

Add Dataverse data-event trigger from Recovery Decisions table, on Modified, filtered for testing to a note column

✓ Agent published

8 Add to Agent feed and trigger once

Add the Handoff agent to the app's Agent feed; update the decision's rationale note and save once

✓ Exactly one Needs attention item that opens the case; decision still Pending

MODULE 4

Module 4 recap: agents that advise, people who decide

BUILT

Business Skill, Disruption Commander, Disruption Approval Handoff Agent, autonomous trigger, Agent feed association

CAPABILITIES USED

Copilot Studio agents, Business Skills, Dataverse MCP, Power Apps MCP, Agent feed

BUSINESS VALUE

Consistent policy, explained recommendations, auditable human handoff

VALIDATE

✓ Commander refuses execution
✓ Exactly one Needs attention item
✓ No approved decision or execution record

MODULE 5

Execute approved recovery — safely, once, with evidence

WHAT YOU WILL BUILD

Carrier Operations Agent, a Computer Use tool, and the Approved Recovery Execution flow

DURATION

60 min

BUSINESS OUTCOME

One approval produces recovery records, one verified carrier registration, and auditable evidence — or a clear Needs Attention task

WHERE IT FITS

The execution path that runs only after the human decision from Module 4's handoff

FROM

Agents that advise (Module 4)

TO

Governed automation and an agent that acts

MODULE 5

Module 5 features at a glance

Vibe coding agents

Describe what you need; Copilot Studio builds the agent or workflow.

Talk track

Workflows

Deterministic automation: same input, same output. Can call an agent and wait.

Built in lab

Computer use (CUA)

An agent tool that uses websites and apps like a person — no API needed.

Built in lab

Harness choice

Standard or GitHub Copilot harness: the runtime shapes capabilities and billing.

Talk track

MODULE 5

Computer use: an agent tool that works like a person

1 DESCRIBE

Natural-language instructions, plus inputs that change each run

2 SEE AND DECIDE

A vision + reasoning model reads the screen and plans the next step

3 ACT

A virtual mouse and keyboard work websites and Windows apps

No API needed
If a person can use the app or site, computer use can too

Adapts to change
Buttons move or screens change; it keeps working

Proof built in
Reasoning log, live preview and a replay of the run

Models: CUA · GPT-6 Sol · Claude Sonnet 4.5 · Claude Sonnet 4.6 and Opus 4.6

MODULE 5

CUA vs RPA: two ways to automate a screen

	RPA — Power Automate desktop flows	Computer use (CUA)
Approach	Rule-based, deterministic	Outcome-based, model-driven
Reads the app via	UI tree and selectors	Vision — the screen itself
You author	A visual script, step by step	Instructions in natural language
Decisions	Predefined rules	Reasoned from what's on screen
When things go wrong	Predefined error handling	Self-corrects from visual feedback
When the UI changes	Selectors need maintenance	Adapts to the new layout
Speed and cost	Machine speed; Power Automate licensing	Step-by-step reasoning; Copilot Credits per step

MODULE 5

When to use which — and why it's often both

	Use RPA when…	Use computer use when…
UI	The UI is stable	UIs shift or vary widely
Decisions	Rules are clear	Decisions are fuzzy
Workload	Speed and volume matter	What's on screen drives the task
Team	An RPA team already owns it	No API and no RPA capacity
Risk	It's mission-critical	A retry or human review is acceptable

BETTER TOGETHER

A workflow orchestrates · RPA runs the steady path · computer use takes the variable step · a person approves what matters

MODULE 5

LAB 5 · STEPS 1–2 OF 9

Build and test the carrier capability

1 Create Carrier Operations Agent

Agent (Standard) in the solution, exact name, repo instructions

✓ Agent saved and named exactly

2 Create Register Shipping Contact

Computer Use tool with 7 inputs, hosted browser, one allowed website, Edge, HTTPS

✓ Tool restricted to the approved site

MODULE 5

LAB 5 · STEPS 3–4 OF 9

Build and test the carrier capability

3 Test once and inspect replay

Run one direct test with fixture values; wait up to 10 minutes

✓ Finished, CARRIER_VERIFIED, Submissions: 1

4 Verify the prepared adapter

Review Invoke Carrier Operations without editing

✓ Execute Agent and wait, durable operation and attempt records

MODULE 5

LAB 5 · STEPS 5–6 OF 9

Build the governed recovery flow

5 Create the flow and router

Dataverse trigger on Recovery Decision changes; Get Decision, Get Case, List CP7; Governed Decision Router

✓ Router checks approval, action, recommendation, no prior CP7

6 Add deterministic recovery

Case-specific purchase order, completed tasks, two unsent drafts, case marked running

✓ Replay guard on purchase order number

MODULE 5

LAB 5 · STEPS 7–9 OF 9

Build the governed recovery flow

7 Call the Carrier agent

Run the Invoke Carrier Operations child flow with a stable operation key

✓ Child flow configured

8 Write evidence or fail closed

CP7 and resolve only for CARRIER_VERIFIED with Activity ID; else Needs Attention; handle Rejected and mismatches

✓ No CP7 in any false branch

9 Save and publish

Do not approve

✓ Both flows in the solution and on

MODULE 5

Module 5 recap: governed, evidenced execution

BUILT
Carrier Operations Agent, Register Shipping Contact, Approved Recovery Execution flow

CAPABILITIES USED
Computer Use, Execute Agent and wait, child flows, choice-based guards, replay protection

BUSINESS VALUE
Approved recovery executes once, with proof — or escalates clearly

VALIDATE
- ✓ One direct test with replay
- ✓ Flow published with all guards
- ✓ Recovery Decision still Pending

NEXT · MODULE 6

Module 6 makes the single approval, watches it run, then deploys to TARGET

TRANSITION

Break

UP NEXT

MODULE 6

Deploy the Control Tower

MODULE 6

6

MODULE 6

Deploy the Control Tower

30 minutes

M1 · Orient | M2 · App | M3 · Automation | M4 · Agents | M5 · Agent + automation | M6 · ALM

MODULE 6

From built components to repeatable deployment

WHAT YOU WILL DO

Package shared policy and the Control Tower into two solutions, version them, and deploy in dependency order.

DURATION

30 min

Power Platform Pipelines

BUSINESS OUTCOME

Repeatable promotion with explicit prerequisites and traceable releases.

WHERE IT FITS

Brings the built components together through ALM.

FROM

Completed app, agents, and flows in DEV

TO

Two versioned, managed solutions in TARGET

MODULE 6

Package components. Deploy prerequisites first.

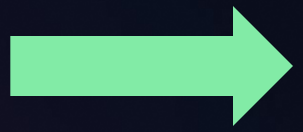

A solution is a versioned container of application components.

Develop in DEV (unmanaged) → deploy to TARGET (managed)

1. INSTALL LIBRARY IN TARGET

PPCC Control Tower Business Skills

ppcc-order-disruption-triage

Prerequisite installed first

2. INSTALL MAIN IN TARGET

PPCC Agentic Operations Control Tower

App, agents, flows, and related components

Same pipeline. Same TARGET stage.
Wait for library Succeeded, then deploy main.

Same publisher. One original Skill. Change membership; keep the component.

MODULE 6

Version the release before you deploy

MAJOR . MINOR . BUILD . REVISION

Part	Typical reason to increment	From 1.1.0.0
Major	Substantial release or compatibility change	2.0.0.0
Minor	New functionality in the current major release	1.2.0.0
Build	New packaged build, often automated	1.1.1.0
Revision	Small correction or revised package	1.1.0.1

These are release conventions; the platform does not infer change impact.

IN THIS LAB

Library 1.0.0.0 → 1.0.0.1 | Main 1.1.0.0 → 1.1.0.1

MODULE 6 | LAB 6

Lab 6 · Deploy the Control Tower

OBJECTIVE	Install two managed solutions in TARGET, in dependency order.
STARTING POINT	Completed components in DEV; assigned pipeline and TARGET; demo account for deployment-time connections.
MAJOR TASKS	1 Create library · 2 Increase versions 3 Deploy library · 4 Deploy main · 5 Confirm installation
COMPONENTS CREATED	Business Skills library + two managed TARGET installations
DEPENDS ON	Modules 1–5; assigned pipeline/stage and environment access
SUCCESS LOOKS LIKE	Both pipeline runs Succeeded; both solutions Managed; TARGET connection bindings configured.

MODULE 6

LAB 6 · STEPS 1–2 OF 5

Prepare the two solutions

1 Create the Skill library

Create PPCC Control Tower Business Skills with the main solution's publisher.

Add the original Skill, then remove its membership from main.

✓ Original Skill and DEV feed remain.

2 Increase both versions

Overview → Edit details → Version

Library: 1.0.0.0 → 1.0.0.1
Main: increase its last number (e.g. 1.1.0.0 → 1.1.0.1)

✓ Both versions increased; they need not match.

MODULE 6

LAB 6 · STEP 3 OF 5

Deploy the Skill library first

3 Deploy the prerequisite

Open the Business Skills library → Pipelines → assigned stage.

Confirm DEV, TARGET, and version. Select Deploy once.

✓ Run Succeeded
✓ Library Managed in TARGET

DEPENDENCY GATE

Business Skills library

Succeeded

Managed in TARGET

Then continue to the main deployment

MODULE 6

LAB 6 · STEP 4 OF 5

Deploy the Control Tower second

4 Deploy main next

Use the same pipeline and TARGET stage.

Create connections in the wizard.
Set PPCC Intake Subject Prefix: PPCC-TARGET

✓ Main deployment Succeeded

MAP ALL SIX BINDINGS

Microsoft Dataverse	2
Microsoft Copilot Studio	1
Power Apps MCP Server	1
Office 365 Outlook	1
Computer use	1

Computer use →
Connect to hosted browser

MODULE 6

LAB 6 · STEP 5 OF 5

Confirm the managed deployment

5 Pipeline run history

Business Skills library
Succeeded

Main Control Tower
Succeeded

✓ Library first, main second

TARGET SOLUTION LIST

PPCC Control Tower Business Skills

Managed

PPCC Agentic Operations Control Tower

Managed

MODULE 6

Module 6 recap: versioned, deployed, dependency-aware

DELIVERED

Two managed solutions in TARGET, installed in dependency order.

CAPABILITIES USED

Solution packaging, version numbering, and Power Platform Pipelines.

BUSINESS VALUE

Repeatable promotion with explicit prerequisites and traceable releases.

VALIDATE

✓ Library first; main second

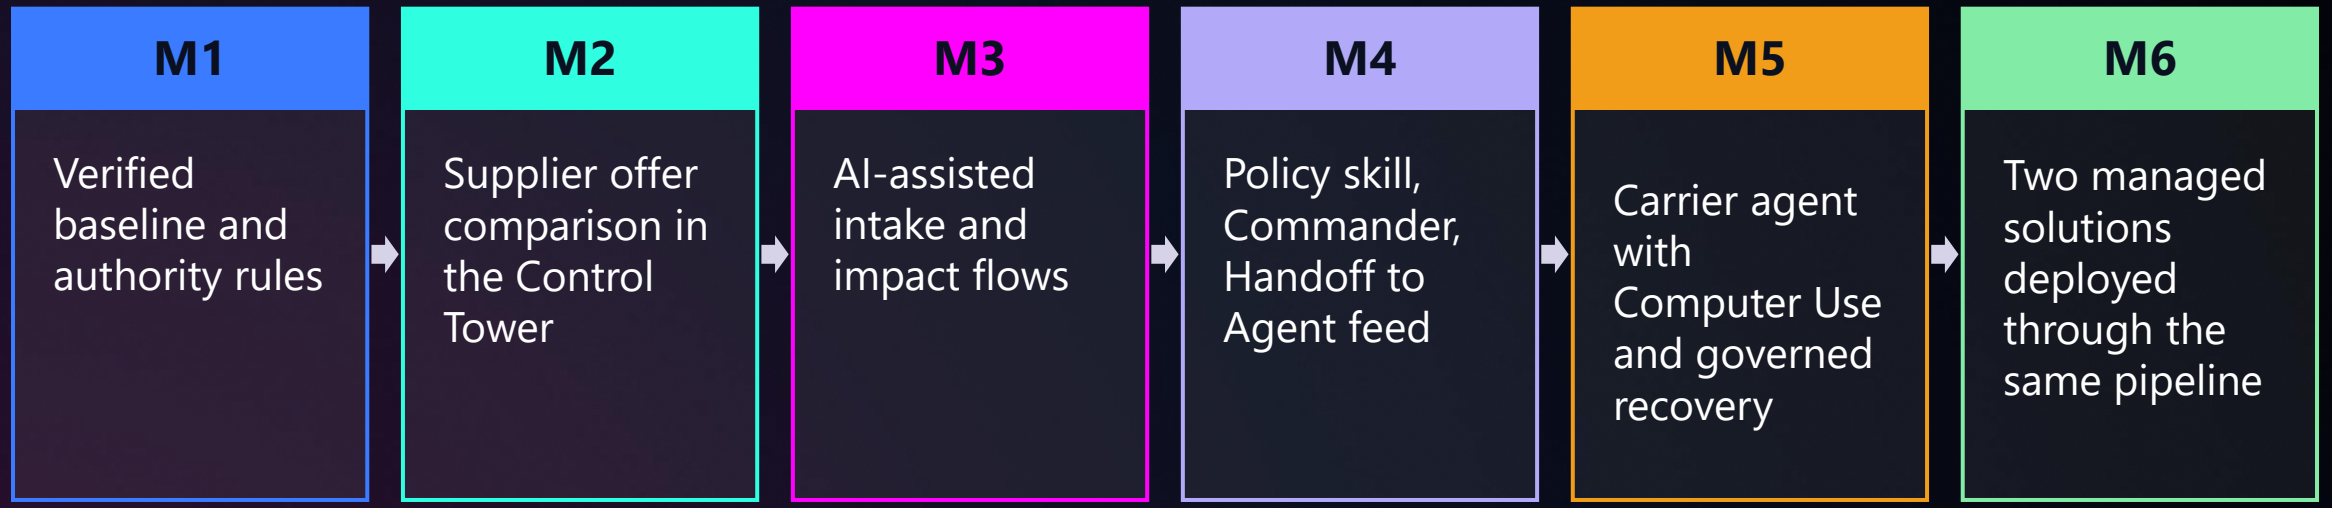

✓ Both pipeline runs Succeeded

✓ Both solutions Managed

✓ TARGET connections mapped

WRAP-UP

What you built today: one intelligent business process

Dataverse — system of record for every step

WRAP-UP

Key takeaways

1. **Extend what exists**
   build on Dataverse and the installed app instead of rebuilding
2. **Let automation calculate and control; let AI interpret and explain**
3. **Bound every agent**
   read-only data, minimal tools, restricted sites
4. **Keep people in charge**
   a recommendation is not approval; approval is persisted in the app
5. **Fail closed and prove it**
   evidence before resolution, pipelines before production

WRAP-UP
